

User Guide

(English Edition)

Step-by-step manual for listeners, creators and administrators. Public address used throughout this guide: <https://cdn.audiolang.cc>. Accounts are created by an administrator — there is no self sign-up. Supported formats: MP3, WAV, M4A, AAC, OGG, FLAC.

CONTENTS

- 1 Sign In
- 2 Homepage — Public Playlist
- 3 Personal Dashboard
- 4 Uploading Audio
- 5 Virtual Folders
- 6 Managing Your Library
- 7 API Docs & Profile
- 8 Admin: Dashboard & Users
- 9 Admin: Audio, Logs & Settings

01 • SIGN IN

Open <https://cdn.audiolang.cc> in your browser. The homepage works without an account — the sidebar only appears after you sign in.

Click Sign in, enter the Email and Password given by your administrator, then press Sign in. A red error box appears under the button if it fails.

Accounts are created by administrators; there is no public registration.

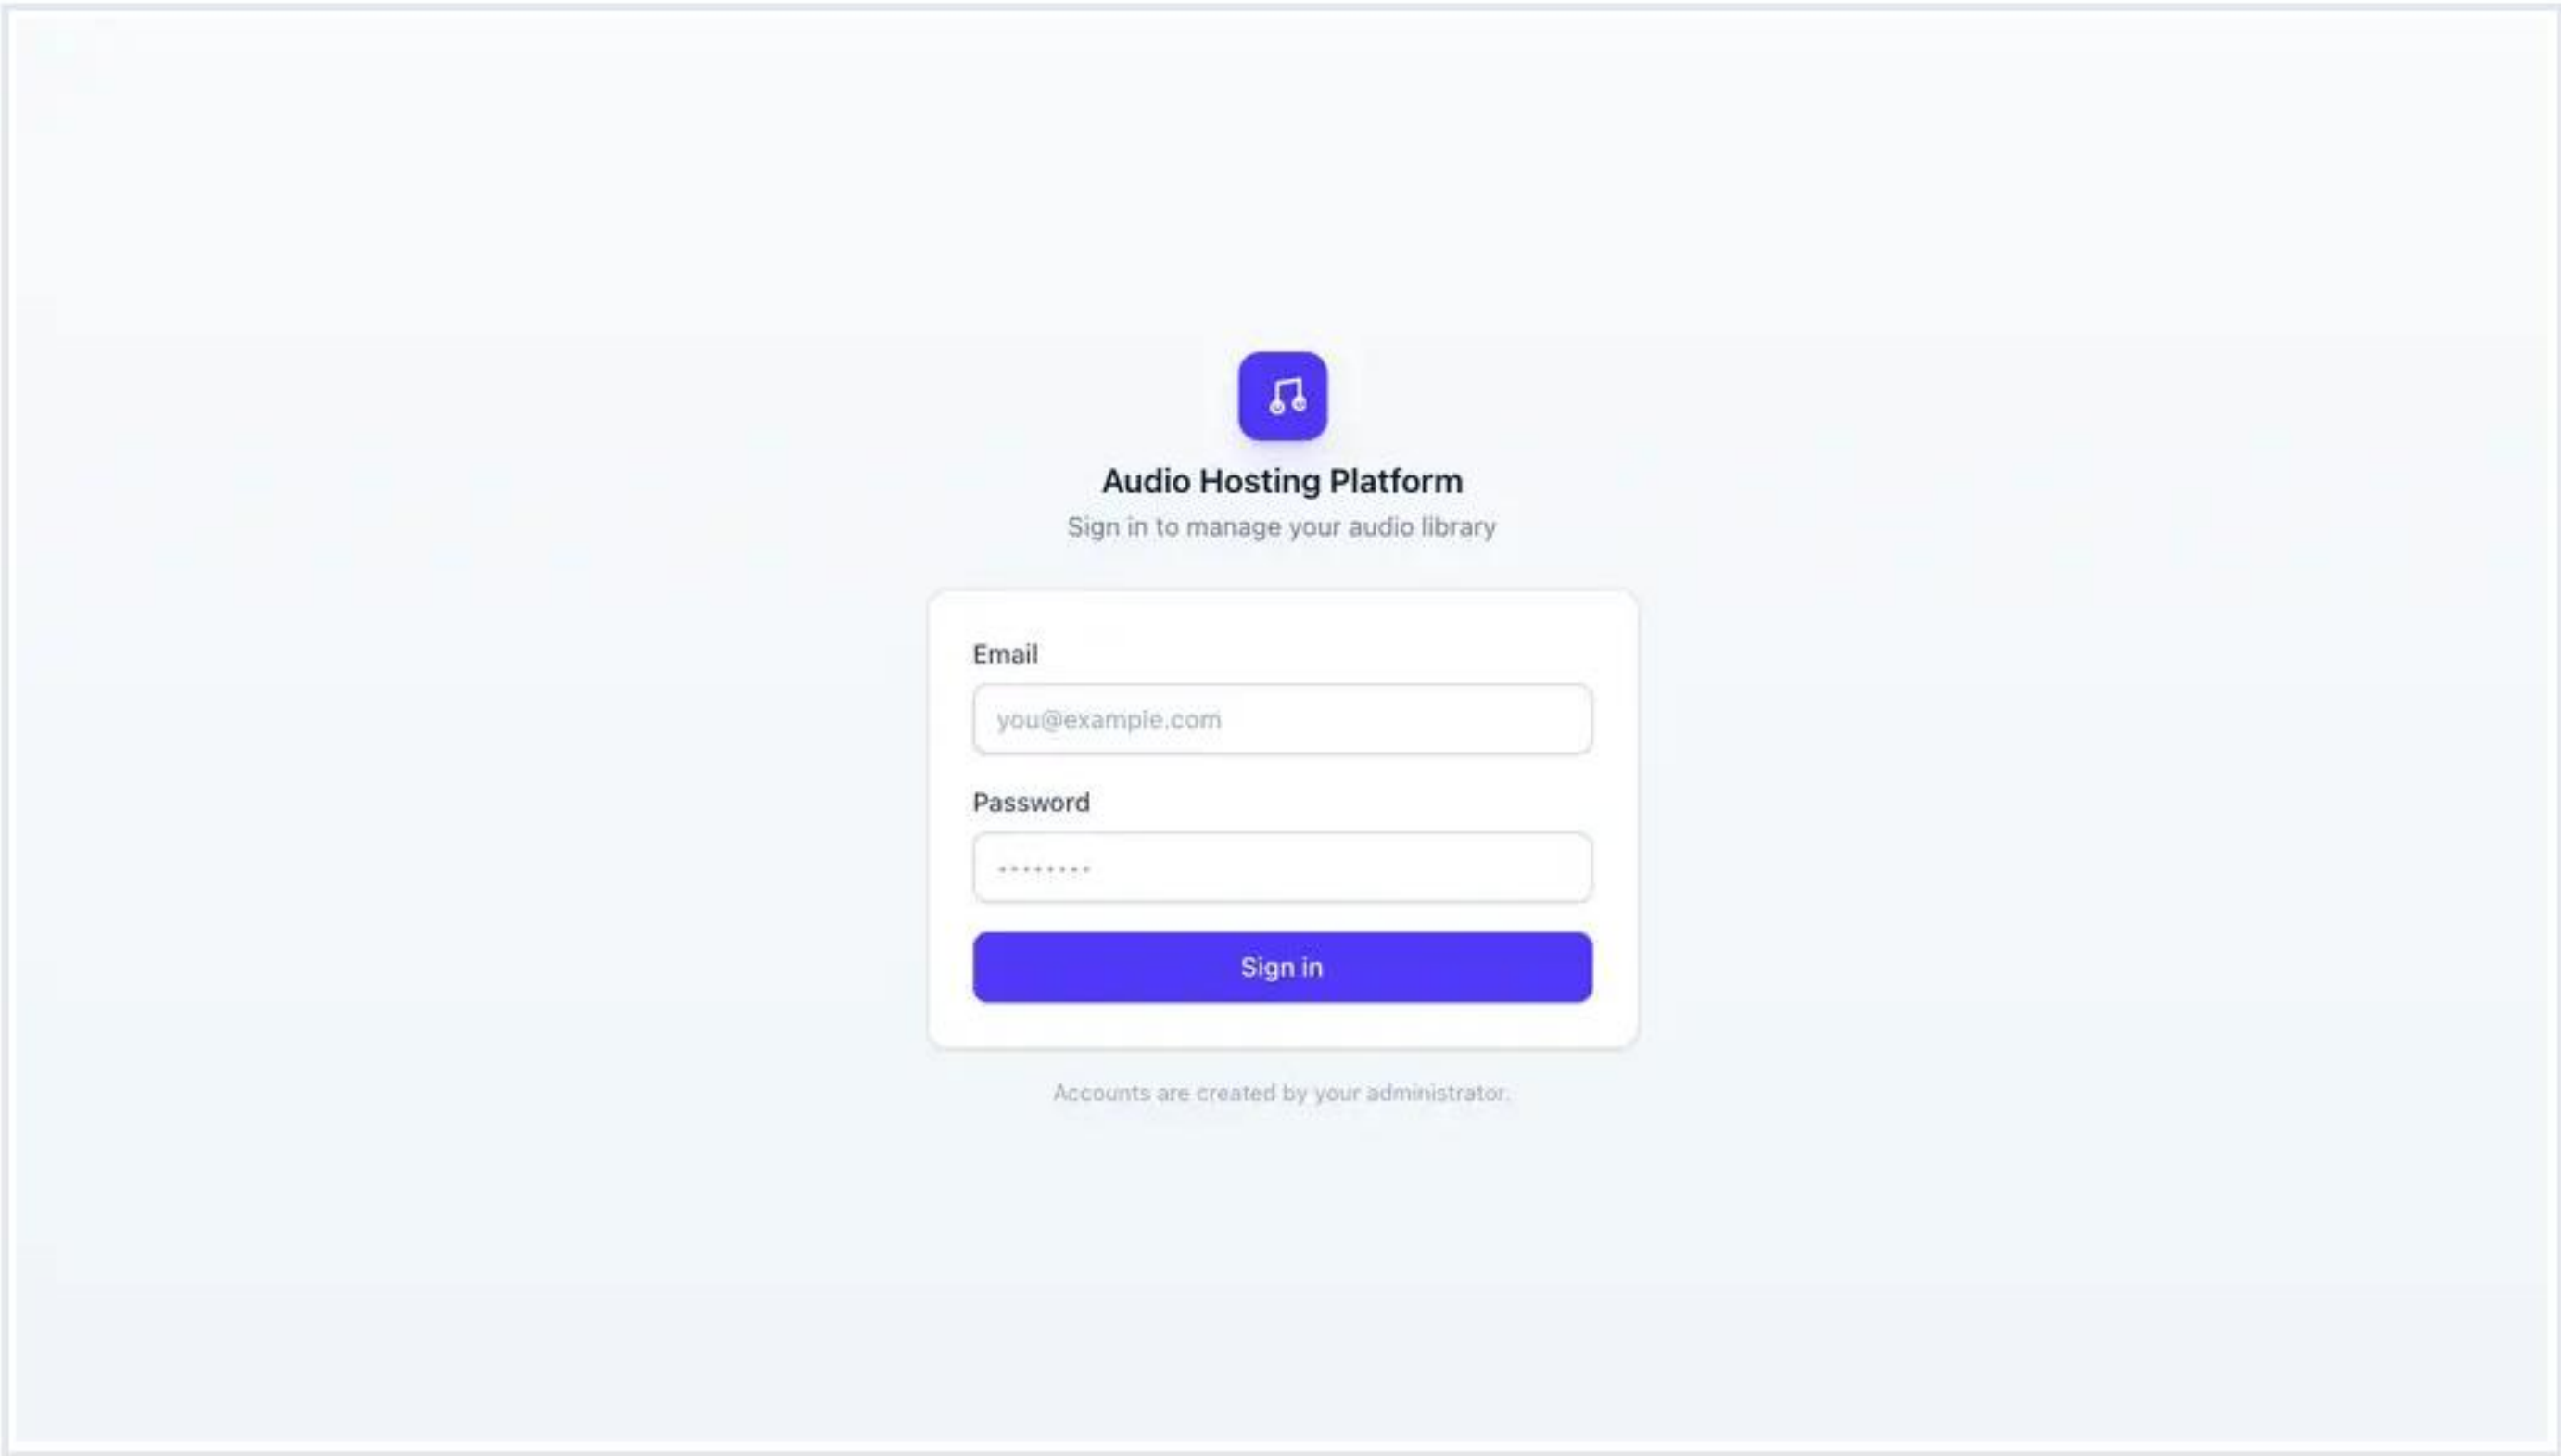

Figure 1 — Sign In

02 • HOMEPAGE — PUBLIC PLAYLIST

The / page lists every track marked Public from every account — no login needed. Header stats show track count, total plays, size and creator count, plus search and sorting (Newest / Most played / Duration / Title).

Click a row to play: a sticky player bar appears at the bottom (previous / stop / next). The link icon copies the public URL, the download icon saves the file.

The Collections shelf above the list shows folders flagged for the homepage. Click a card to expand its public tracks with mini players.

03 • PERSONAL DASHBOARD

After sign-in open Dashboard from the sidebar or the Open Dashboard button. Cards show your Total Audio, Storage Used, Uploads Today, Plays Today and API Requests Today. Your Tracks lists only files you uploaded (newest first) with search. Recent Activity logs your uploads, plays and API calls.

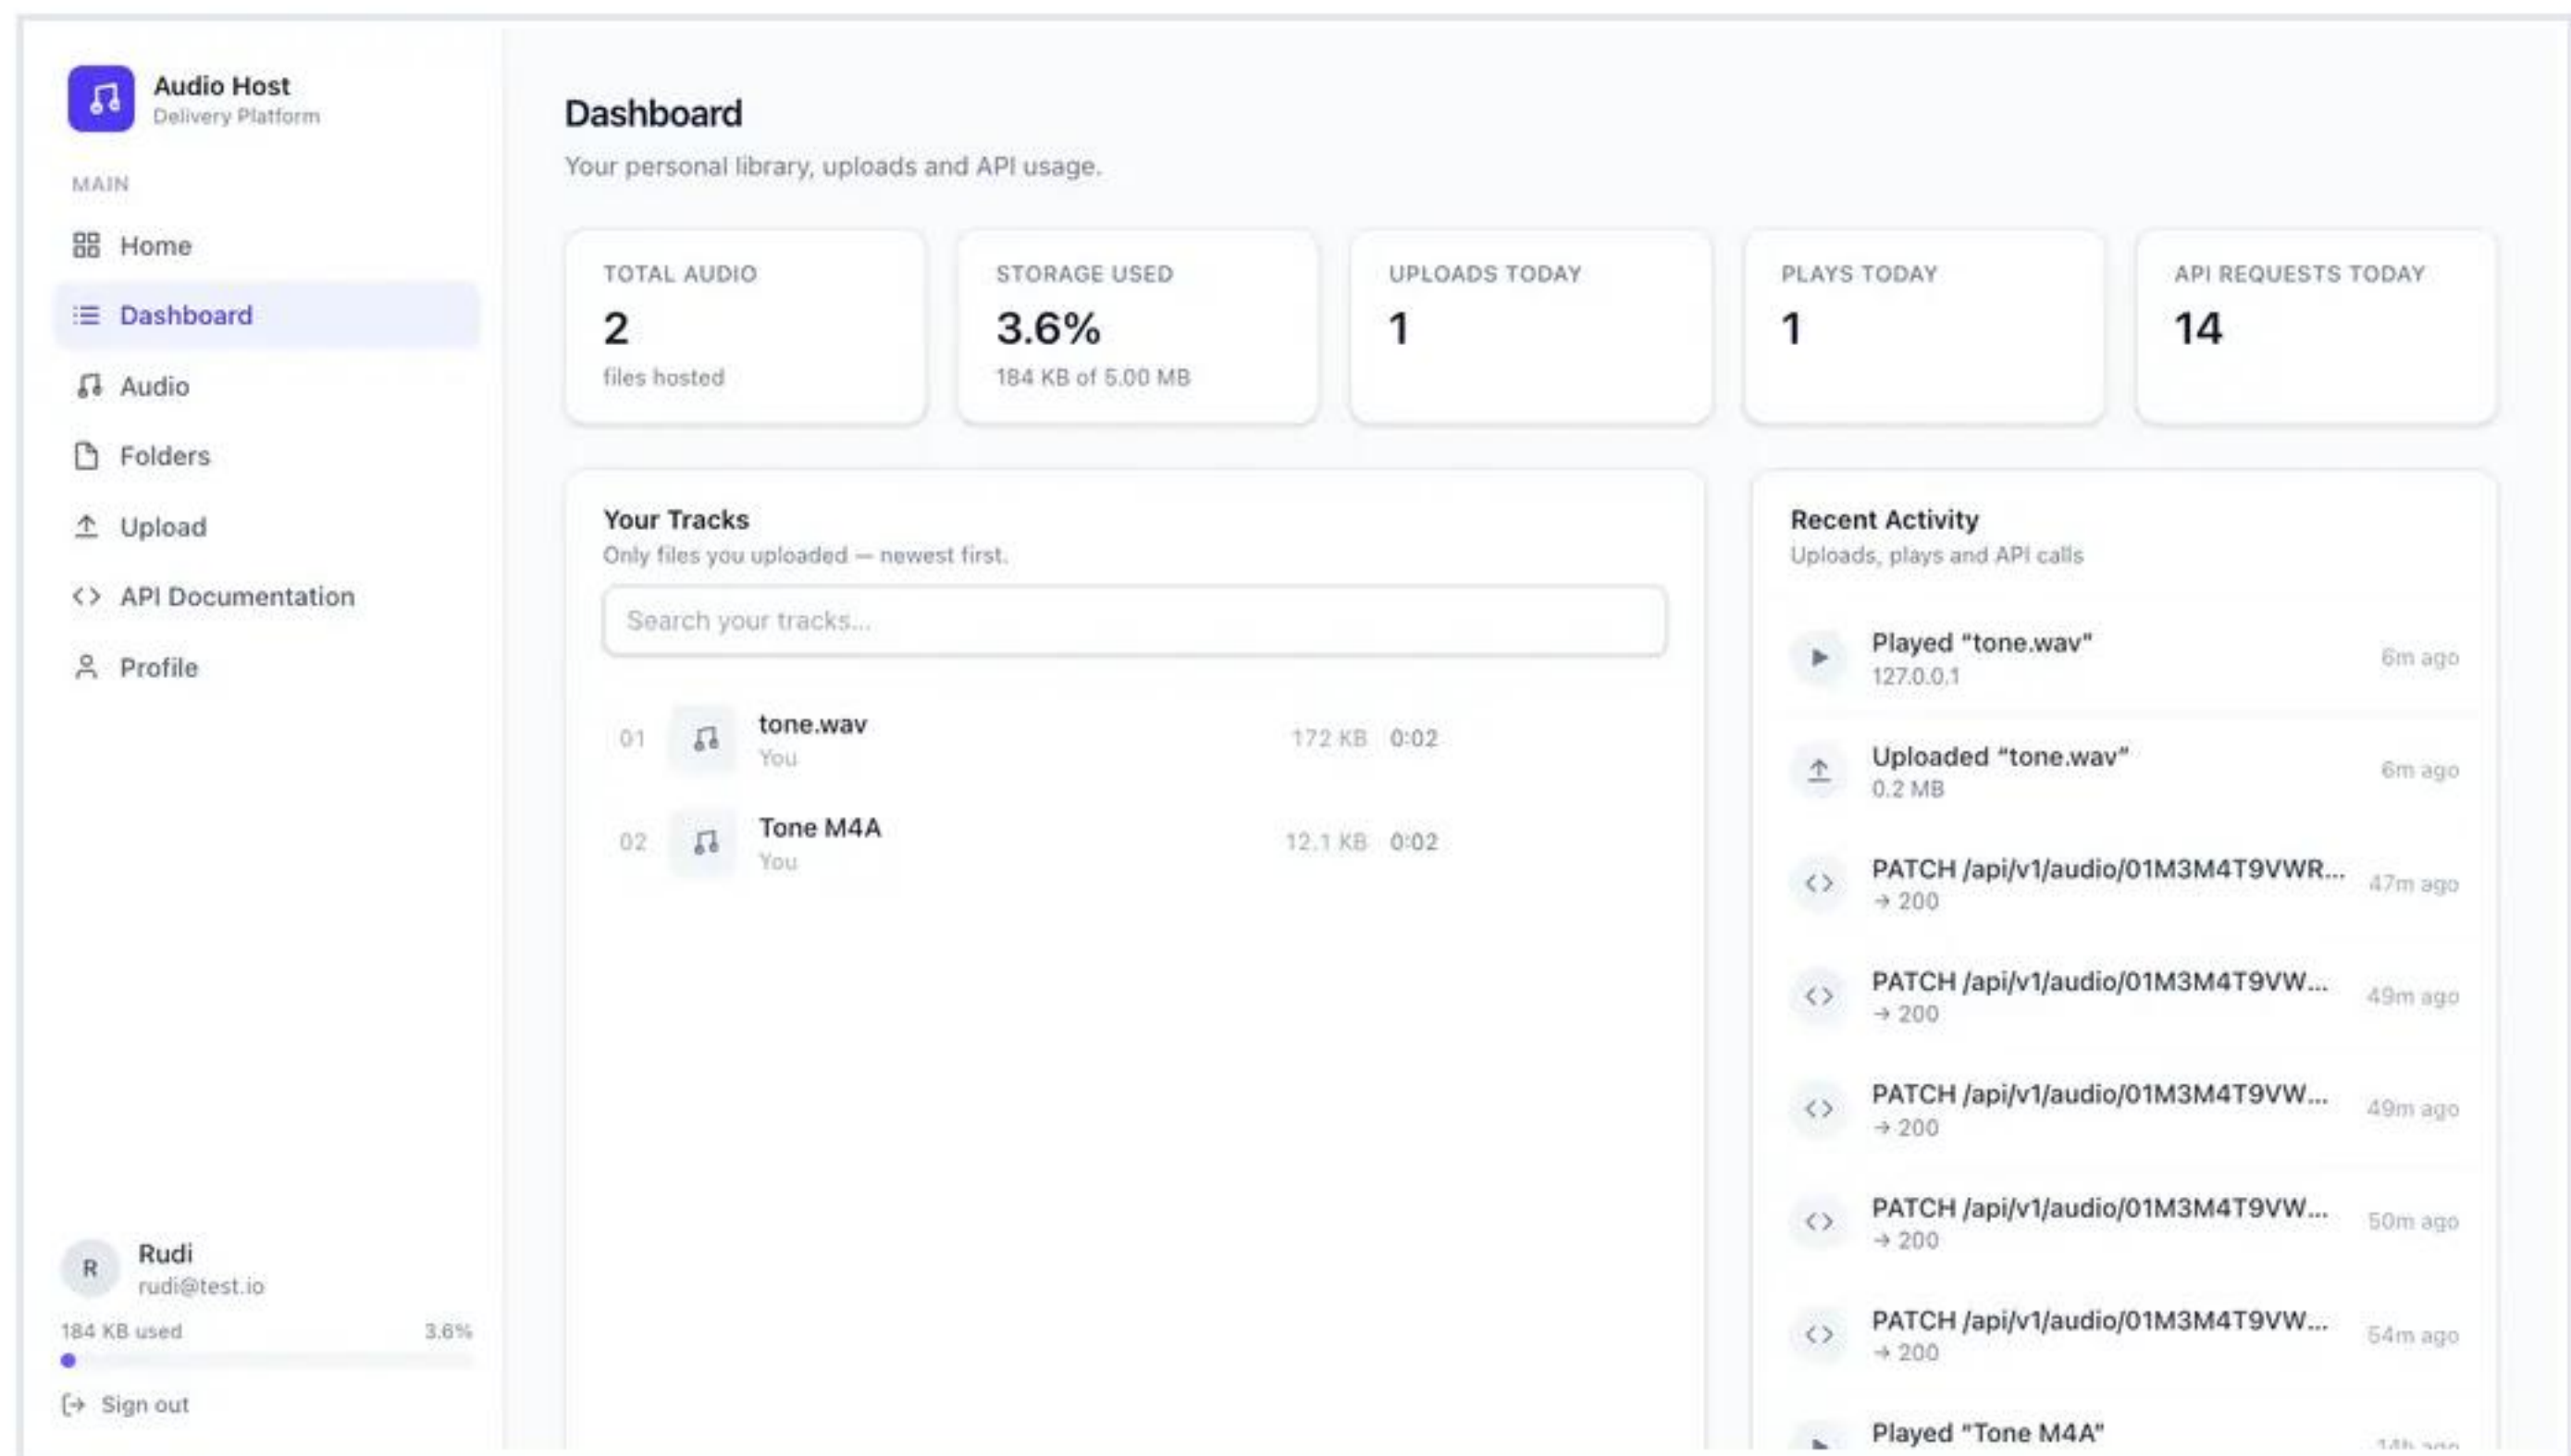

Figure 3 — Personal Dashboard

04 • UPLOADING AUDIO

Open Upload. Drag files onto the dashed area or click to browse — multiple files queue up and upload one by one with a live percent bar. Fill Title (applies when a single file is queued), Description, Visibility (Public = anyone with the URL can listen; Private = authenticated API only) and destination Folder (optional). Each finished card shows a player, the public URL with Copy URL, Copy Embed, and a Manage link. Over-quota files are rejected before upload; a PHP file renamed to .mp3 is rejected with INVALID_FILE_TYPE.

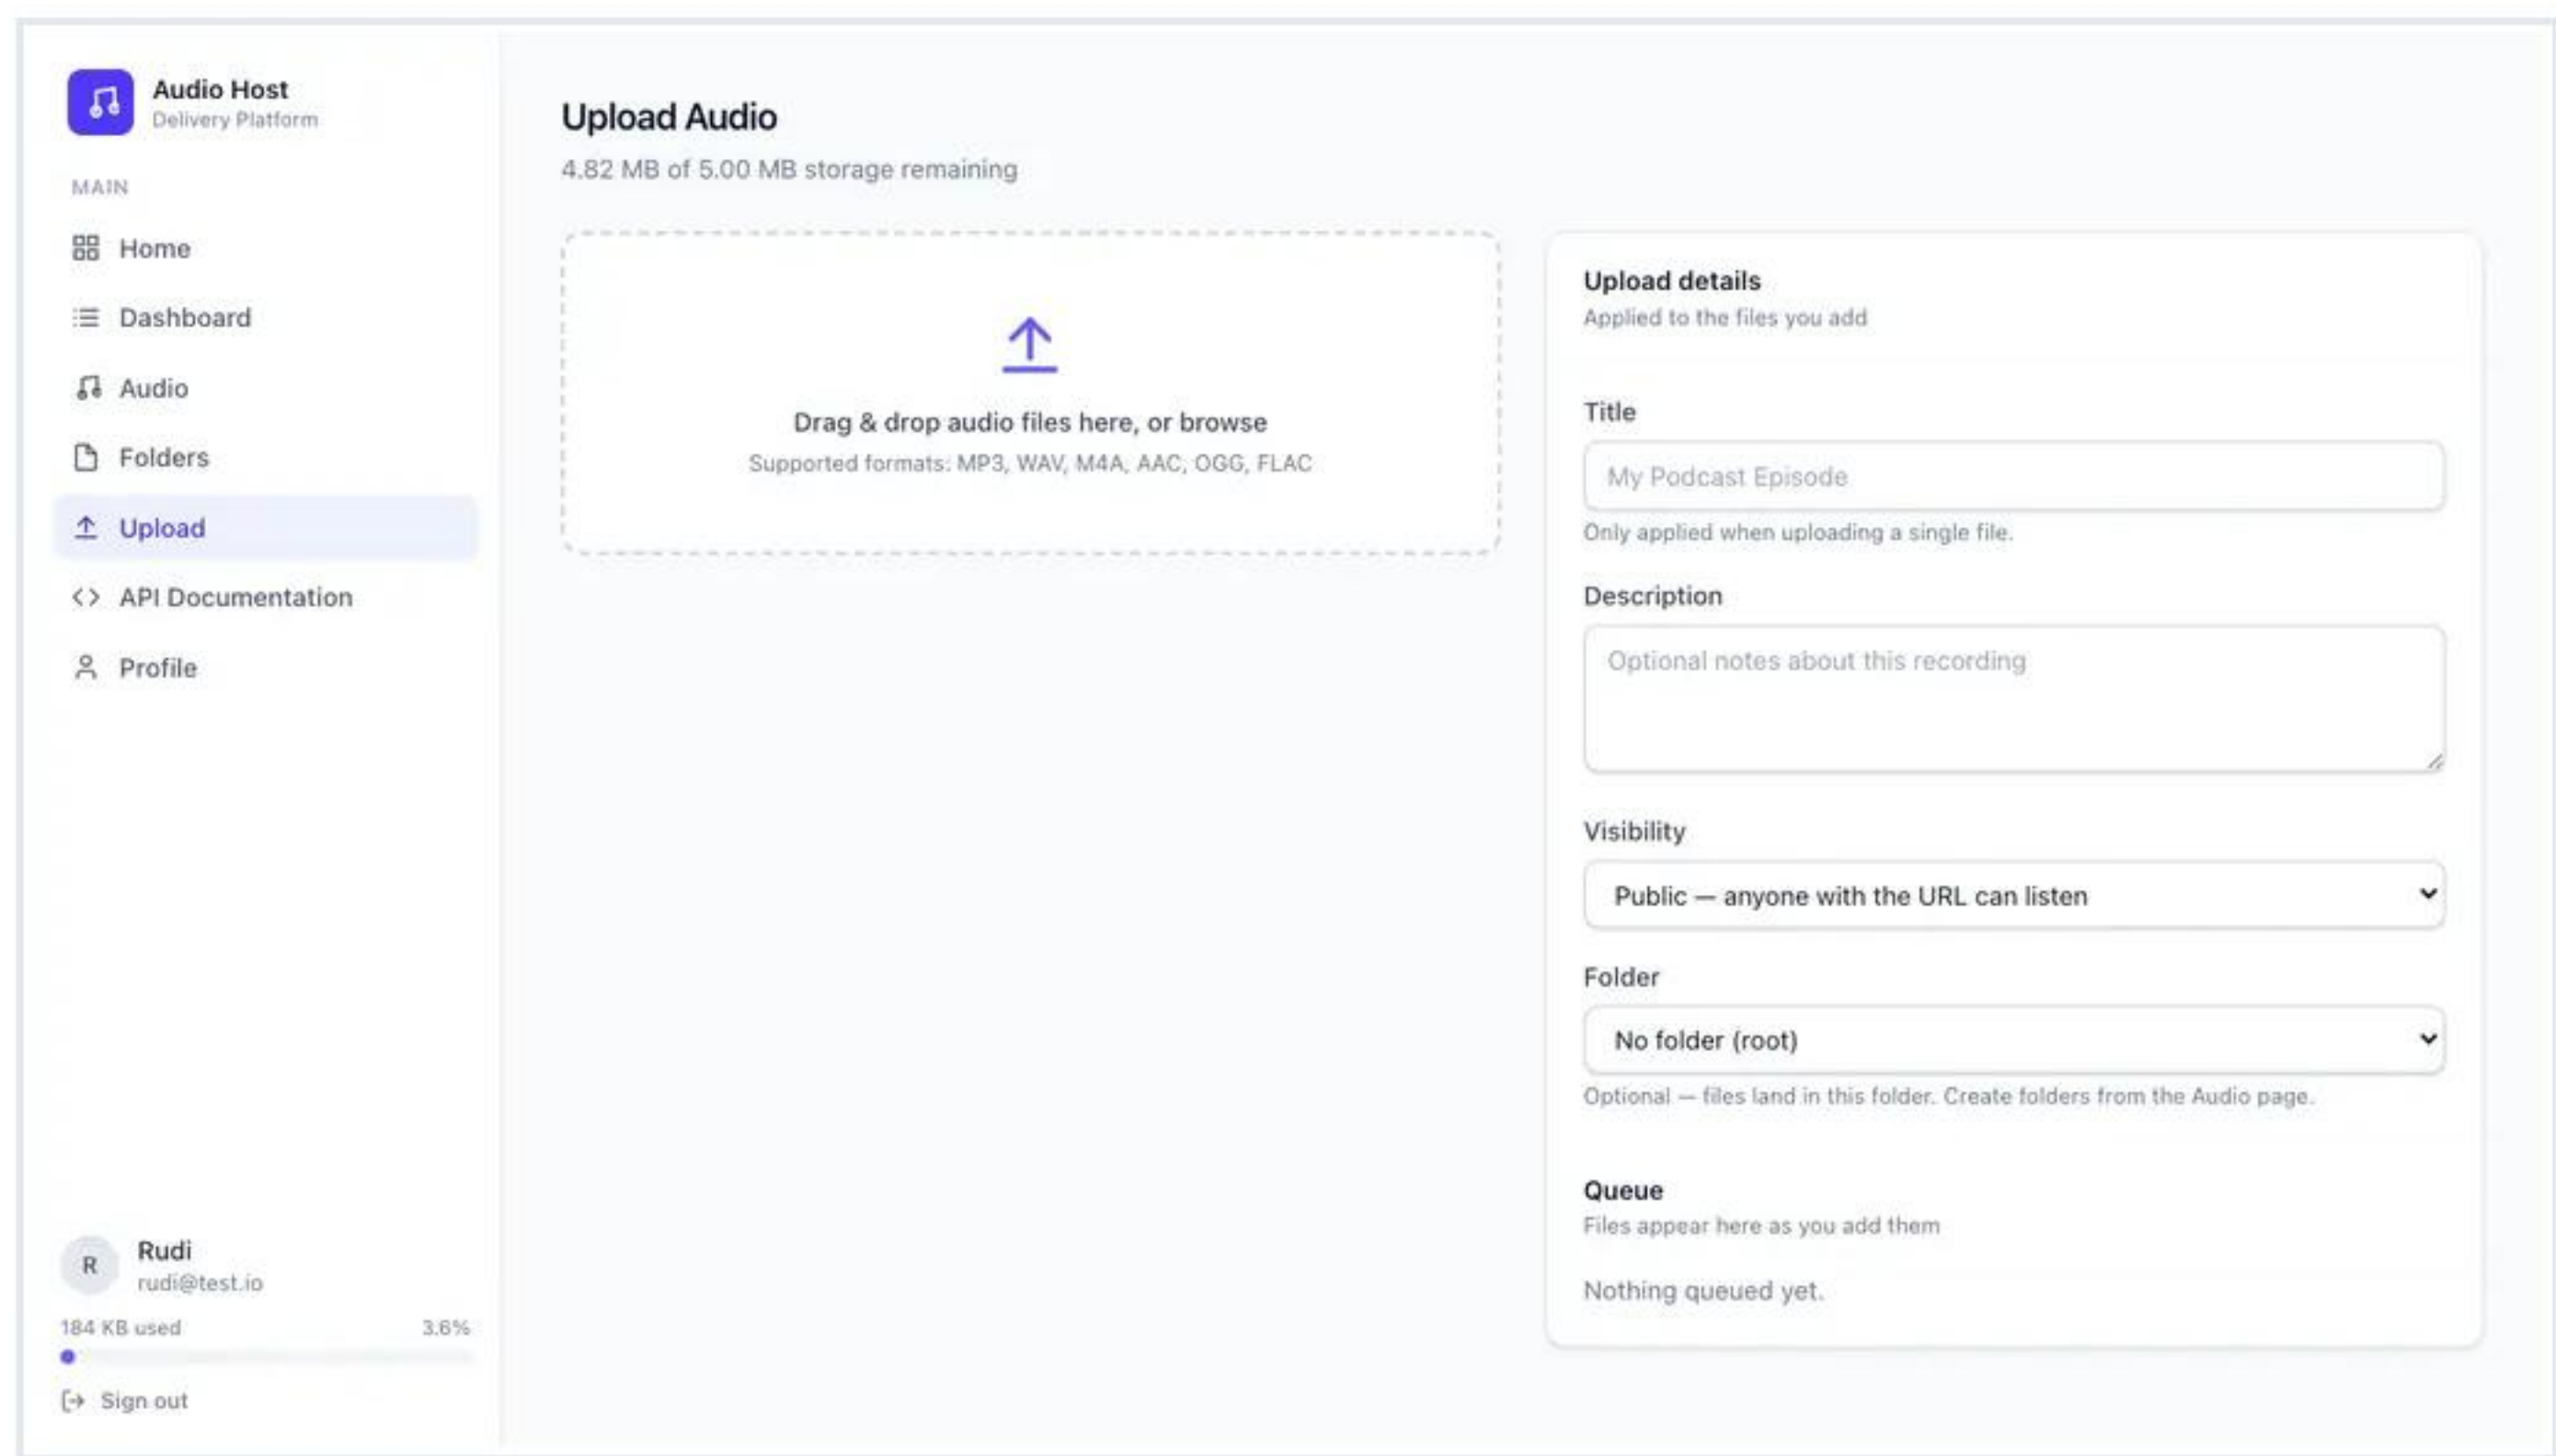

Figure 4 — Uploading Audio

05 • VIRTUAL FOLDERS

Folders are virtual (one level, no sub-folders): physical files never move, only a database tag. Open Folders, then New Folder: a per-account unique name, Visibility, and Show on public homepage (requires Public visibility). Assign files via the Folder dropdown during upload, the folder filter on the Audio page, or the Edit form in a track's details. Deleting a folder moves its tracks back to root — or deletes them permanently if you tick the box. Folder badges appear in the Audio table; the Audio page filters by All folders / No folder / each folder.

06 • MANAGING YOUR LIBRARY

The Audio page holds everything you own: search title/filename/description, filter format and folder, sort by date/title/size/duration/plays.

Play streams instantly; Details & embed opens full metadata (MIME, container, codec, bitrate, sample rate, channels, duration, size, ID), playback stats (total, today, 7 days, last played, unique visitors), an Edit form (title/description/visibility/folder), ready-to-copy `<audio>` and `<iframe>` snippets, and a live preview.

Delete always asks for confirmation and removes bytes, the database row and its access logs.

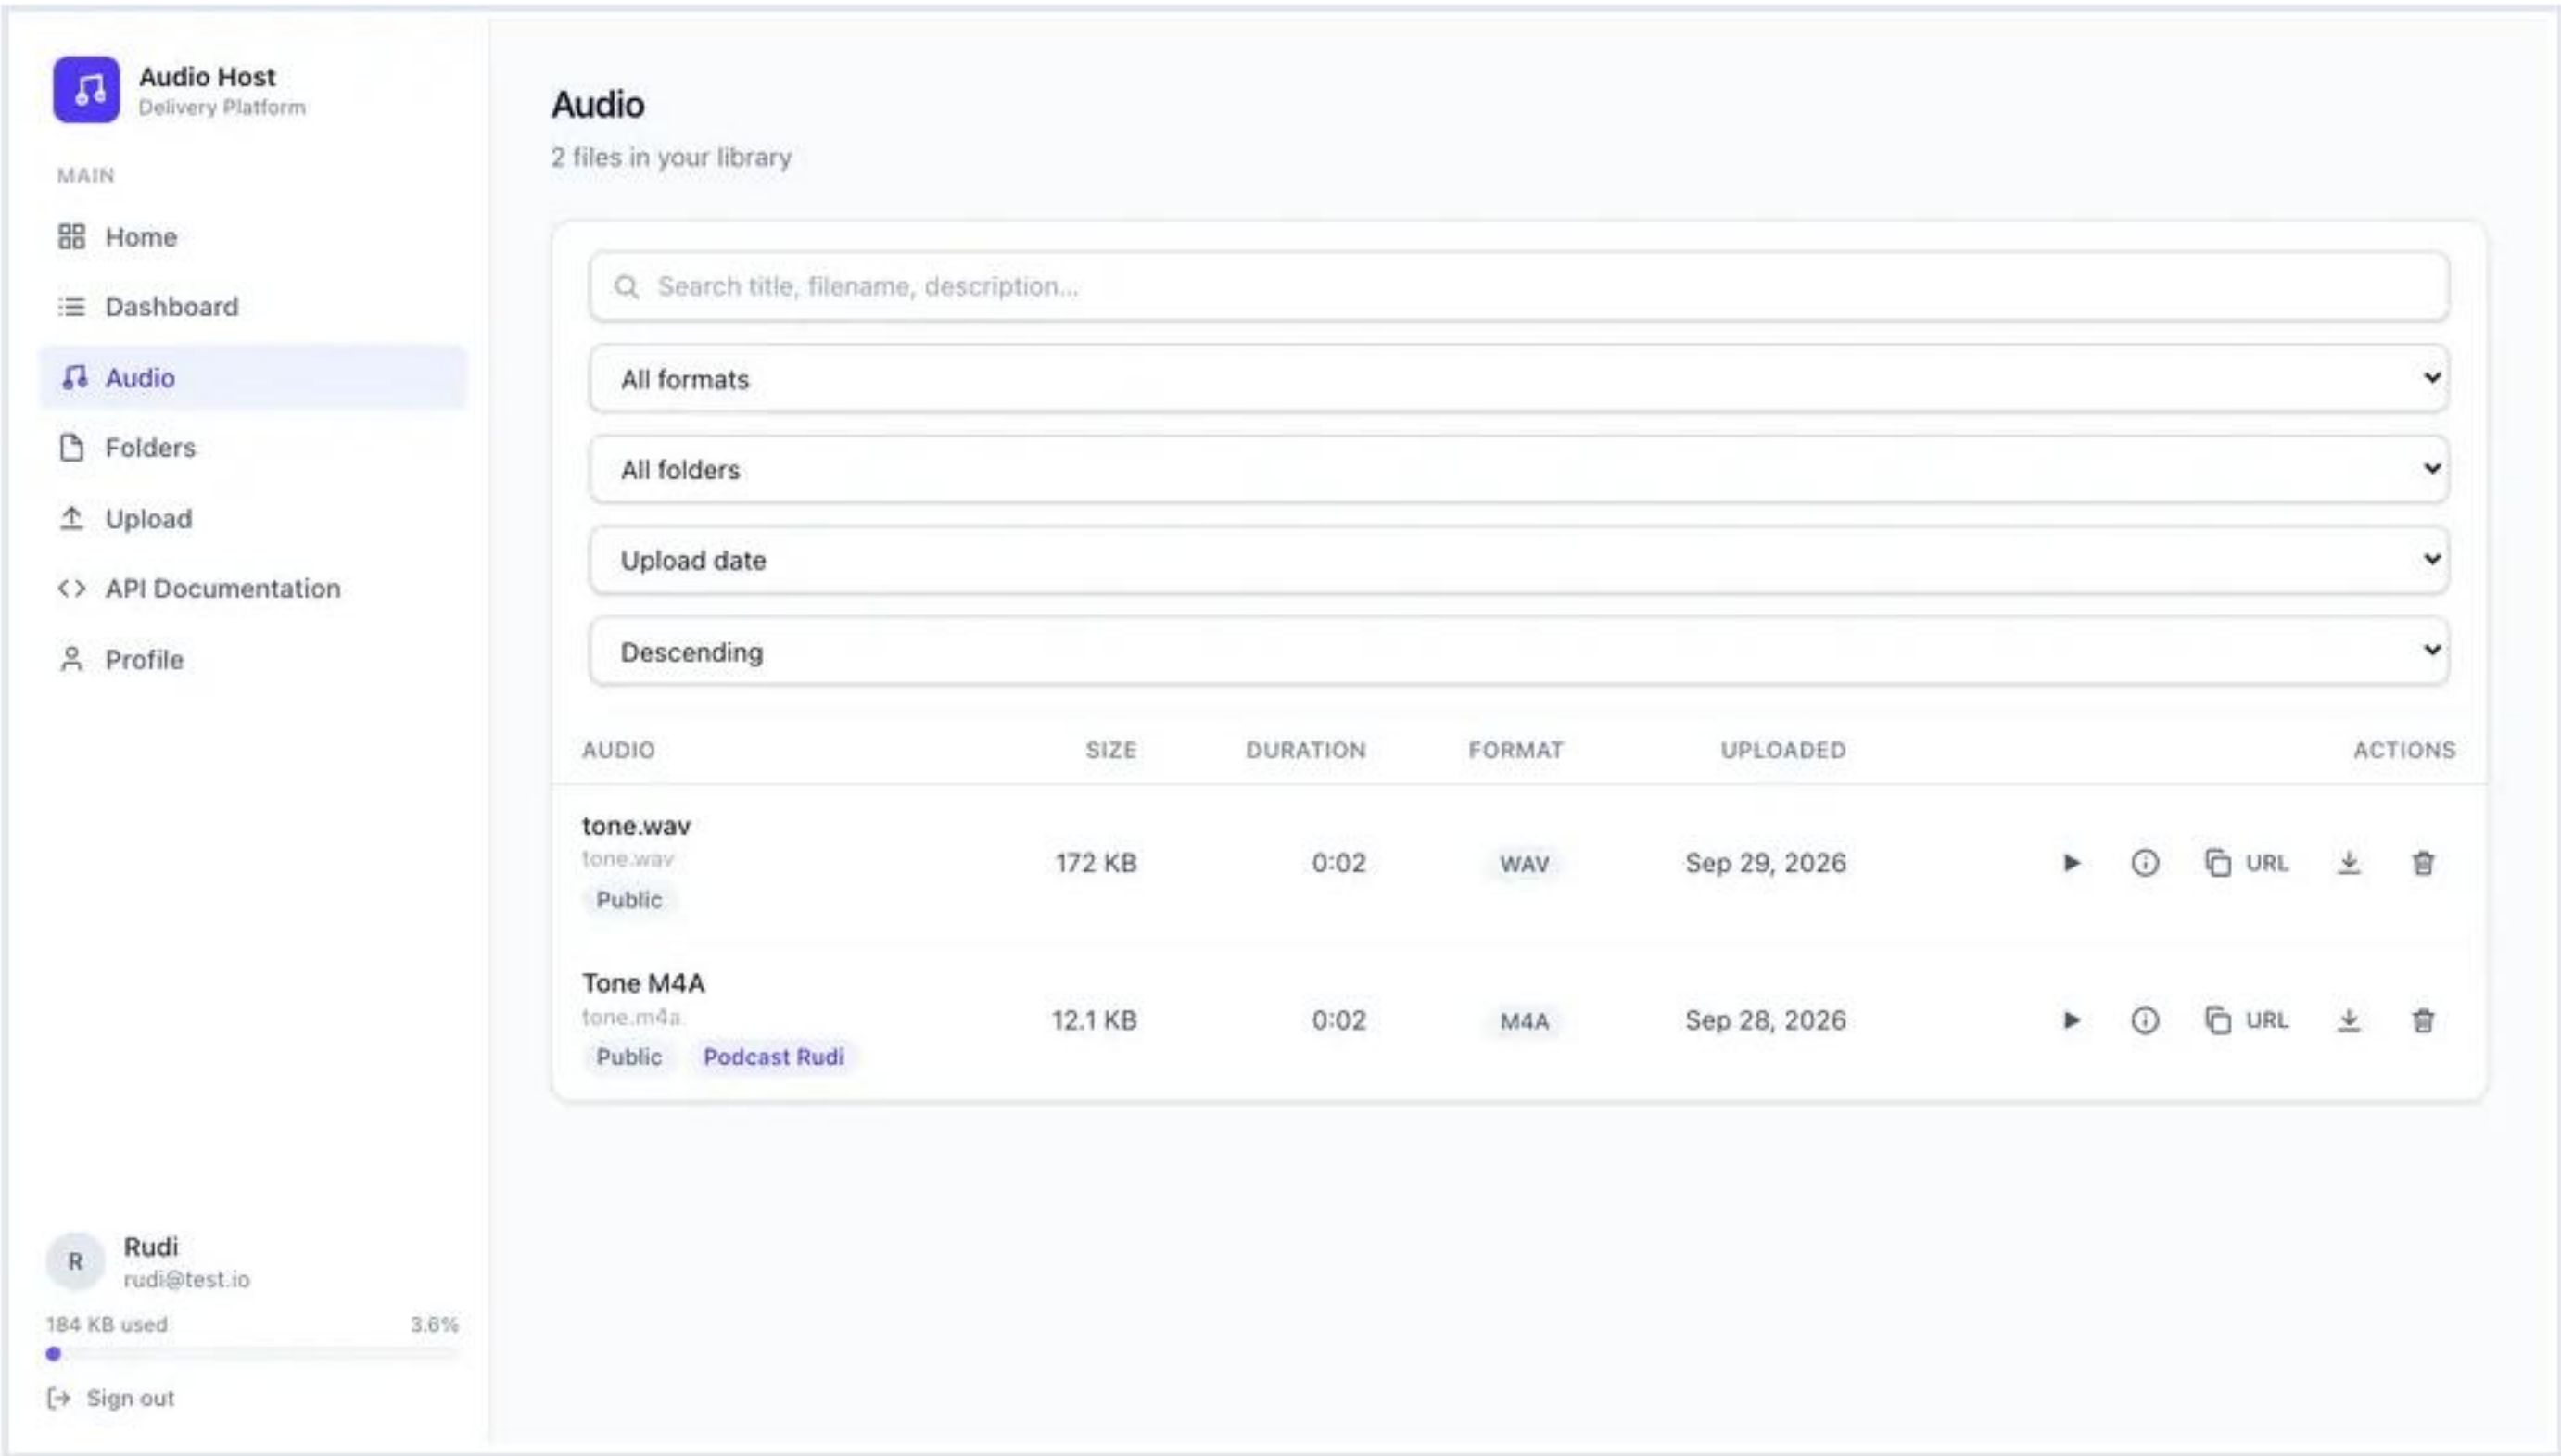

Figure 6 — Managing Your Library

07 • API DOCS & PROFILE

The API Documentation page explains Base URL `https://cdn.audiolang.cc/api/v1`, the Authorization: Bearer aud_... header, every endpoint (me, upload, list, detail, patch, delete), success/error envelopes, the error-code table, cURL / JavaScript / PHP / Python samples, embedding, rate limits and CORS.

The Profile page shows account data, storage usage, your masked API token (Regenerate shows the full token ONCE — copy it immediately), and password change (signs you out everywhere).

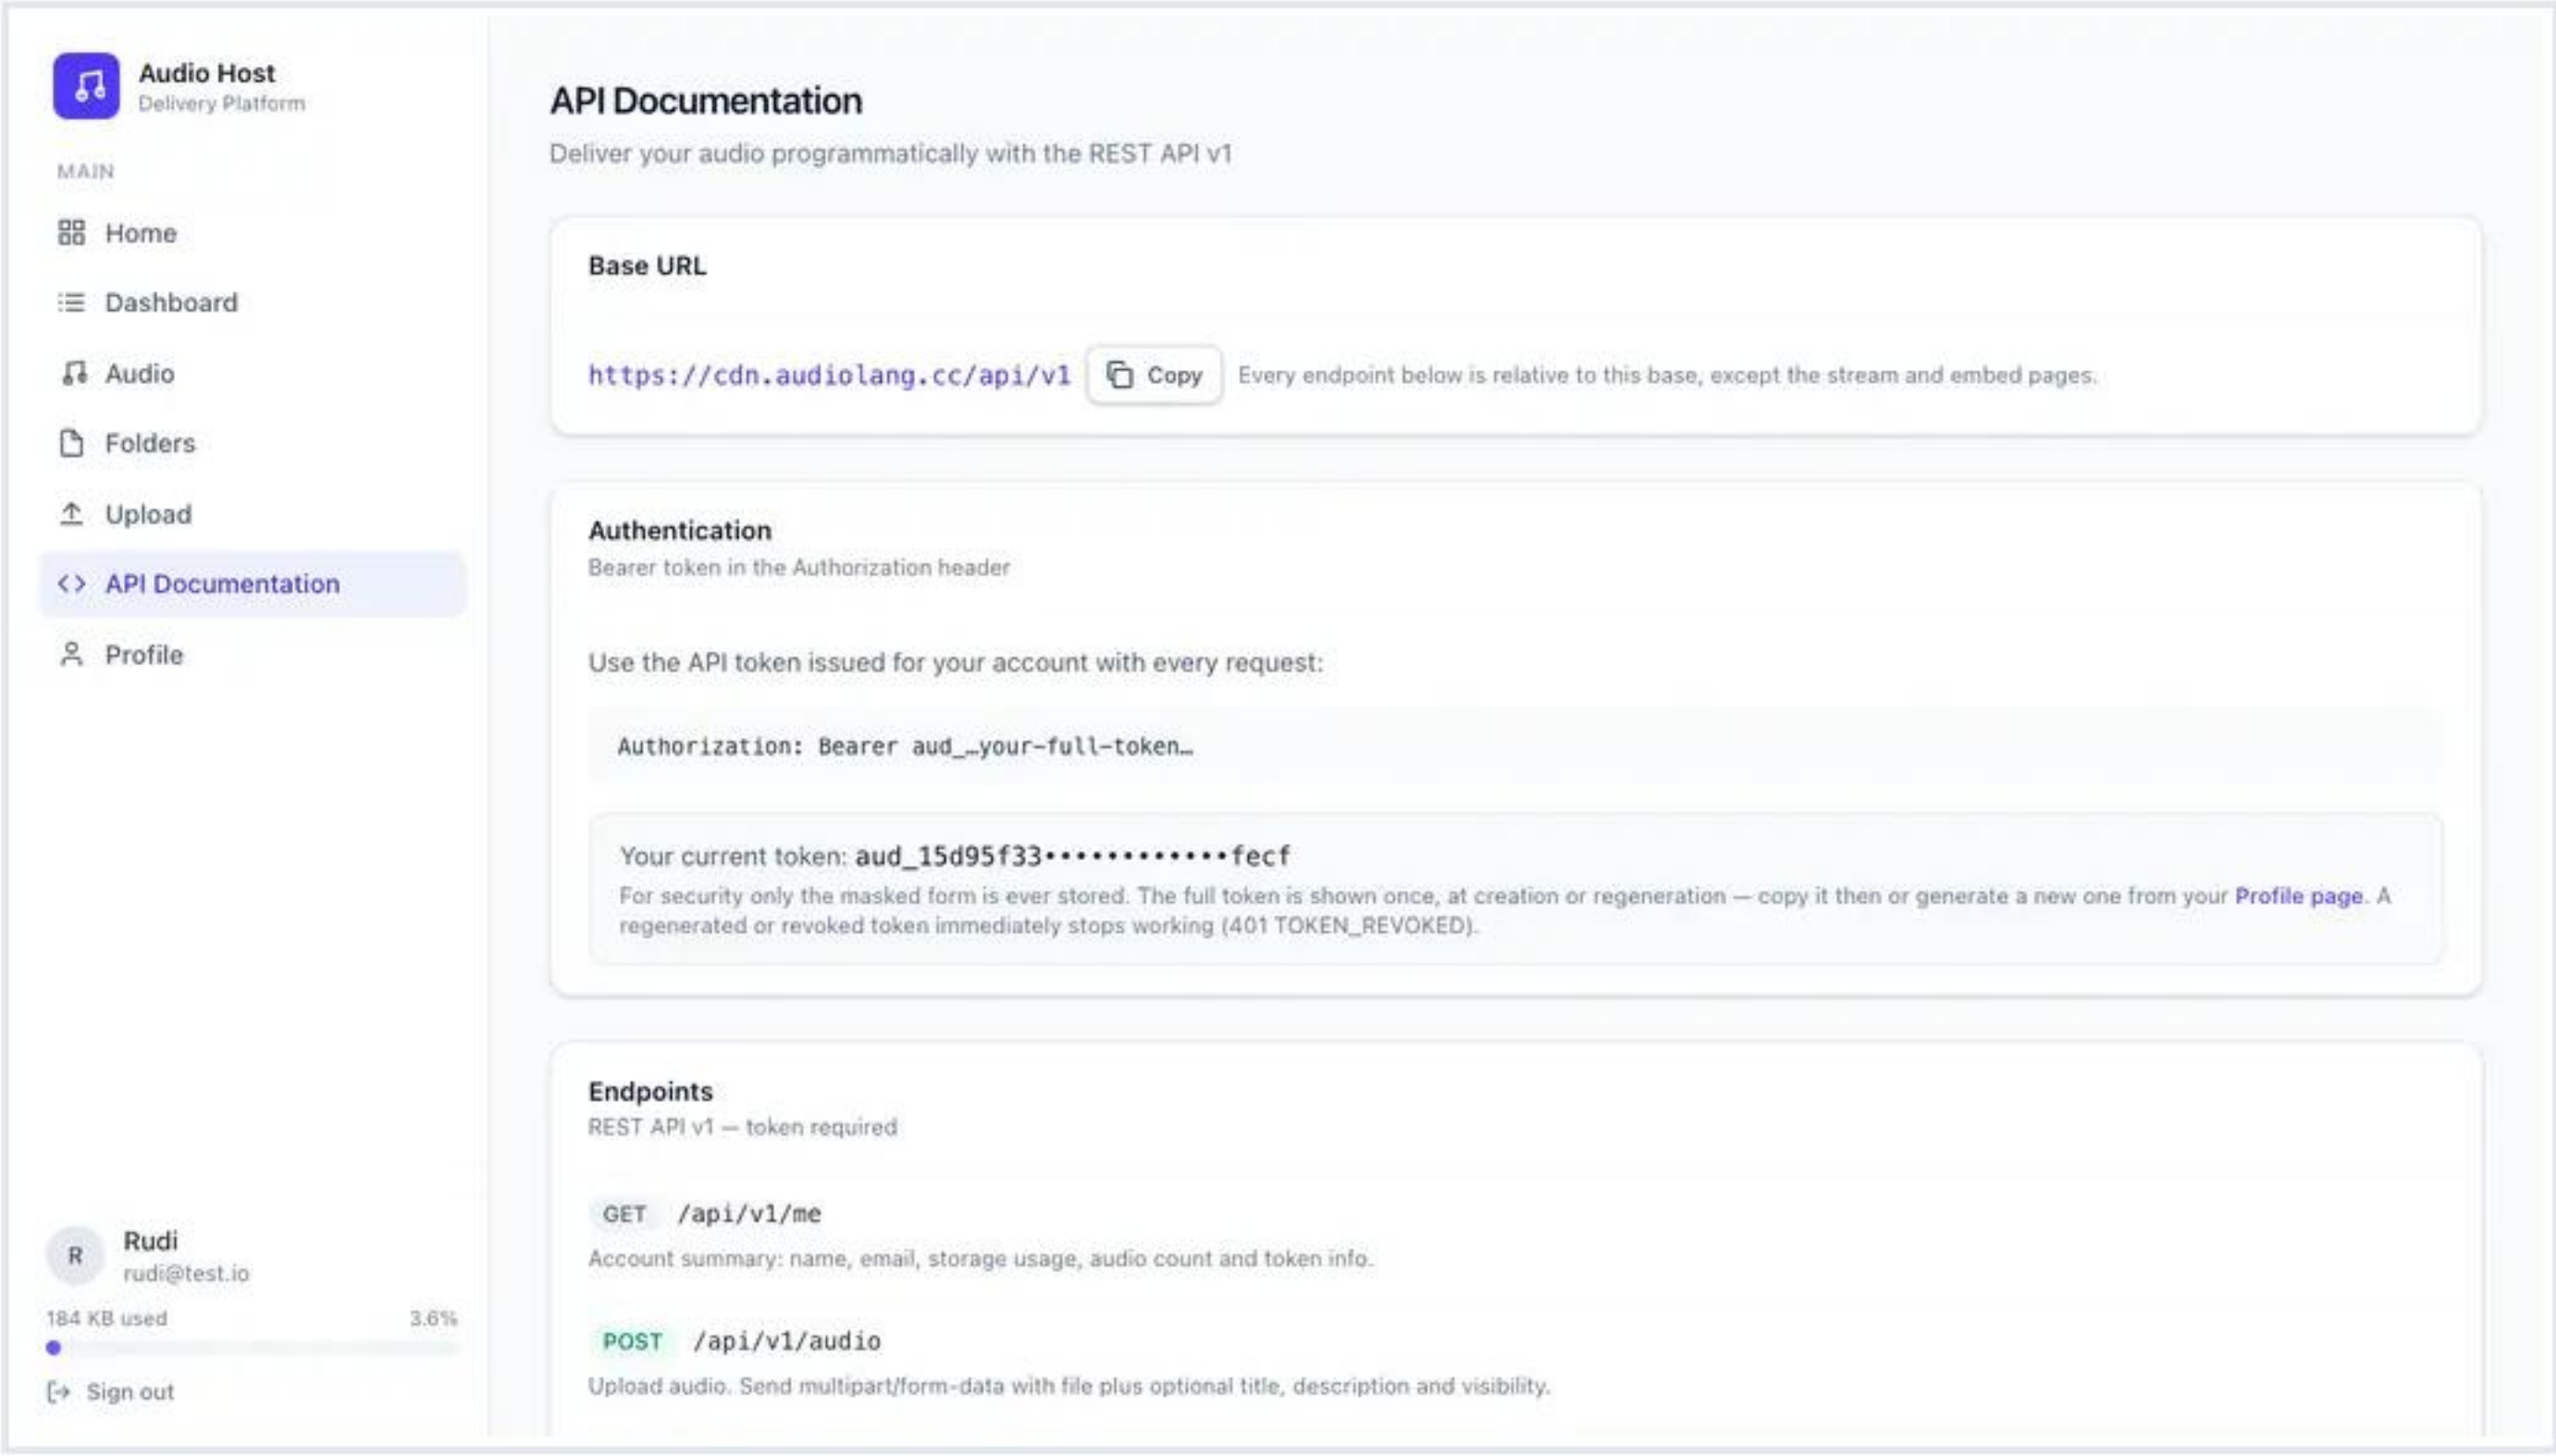

Figure 7 — API Docs & Profile

08 • ADMIN: DASHBOARD & USERS

Admin Dashboard shows Total Users, Total Audio, Total Storage, Uploads Today, API Requests Today (+ error count), top storage consumers and newest platform-wide uploads.

The Users page searches name/email, creates users (full token shown once), opens detail (edit, reset password, regenerate/revoke token, that user's tracks, delete user with all files), and disables/enables accounts.

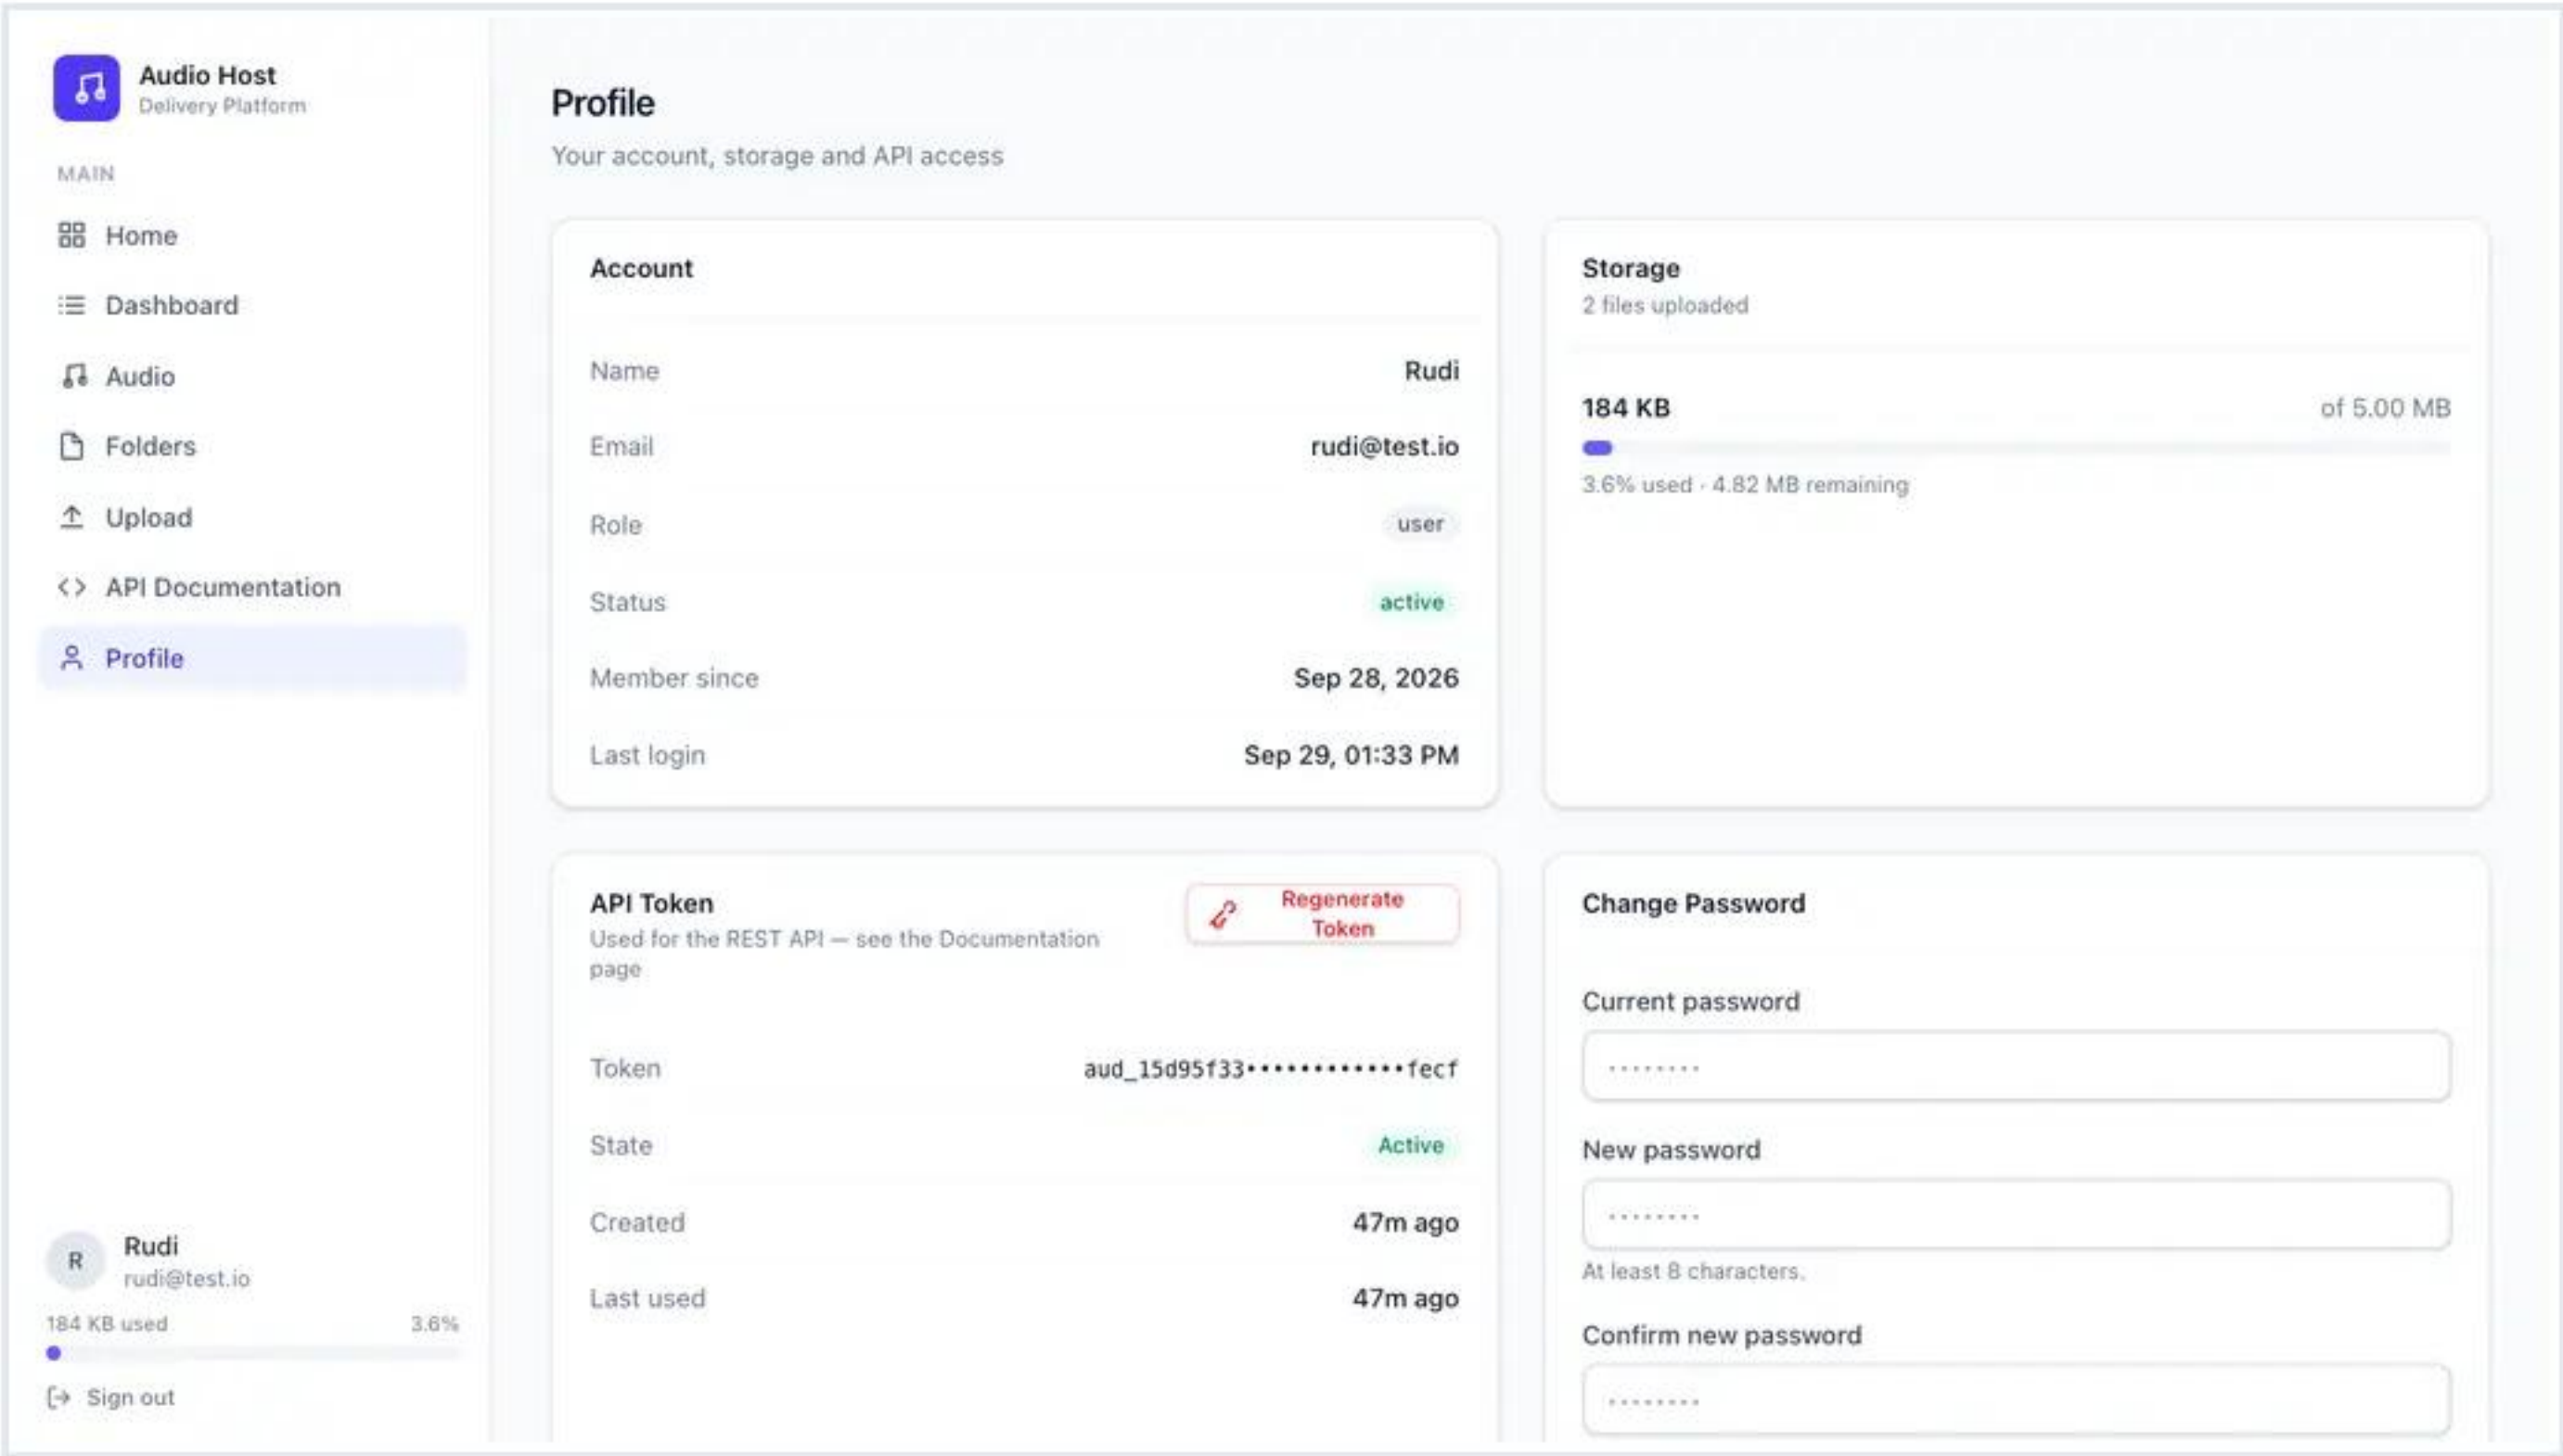

Figure 8 — Admin: Dashboard & Users

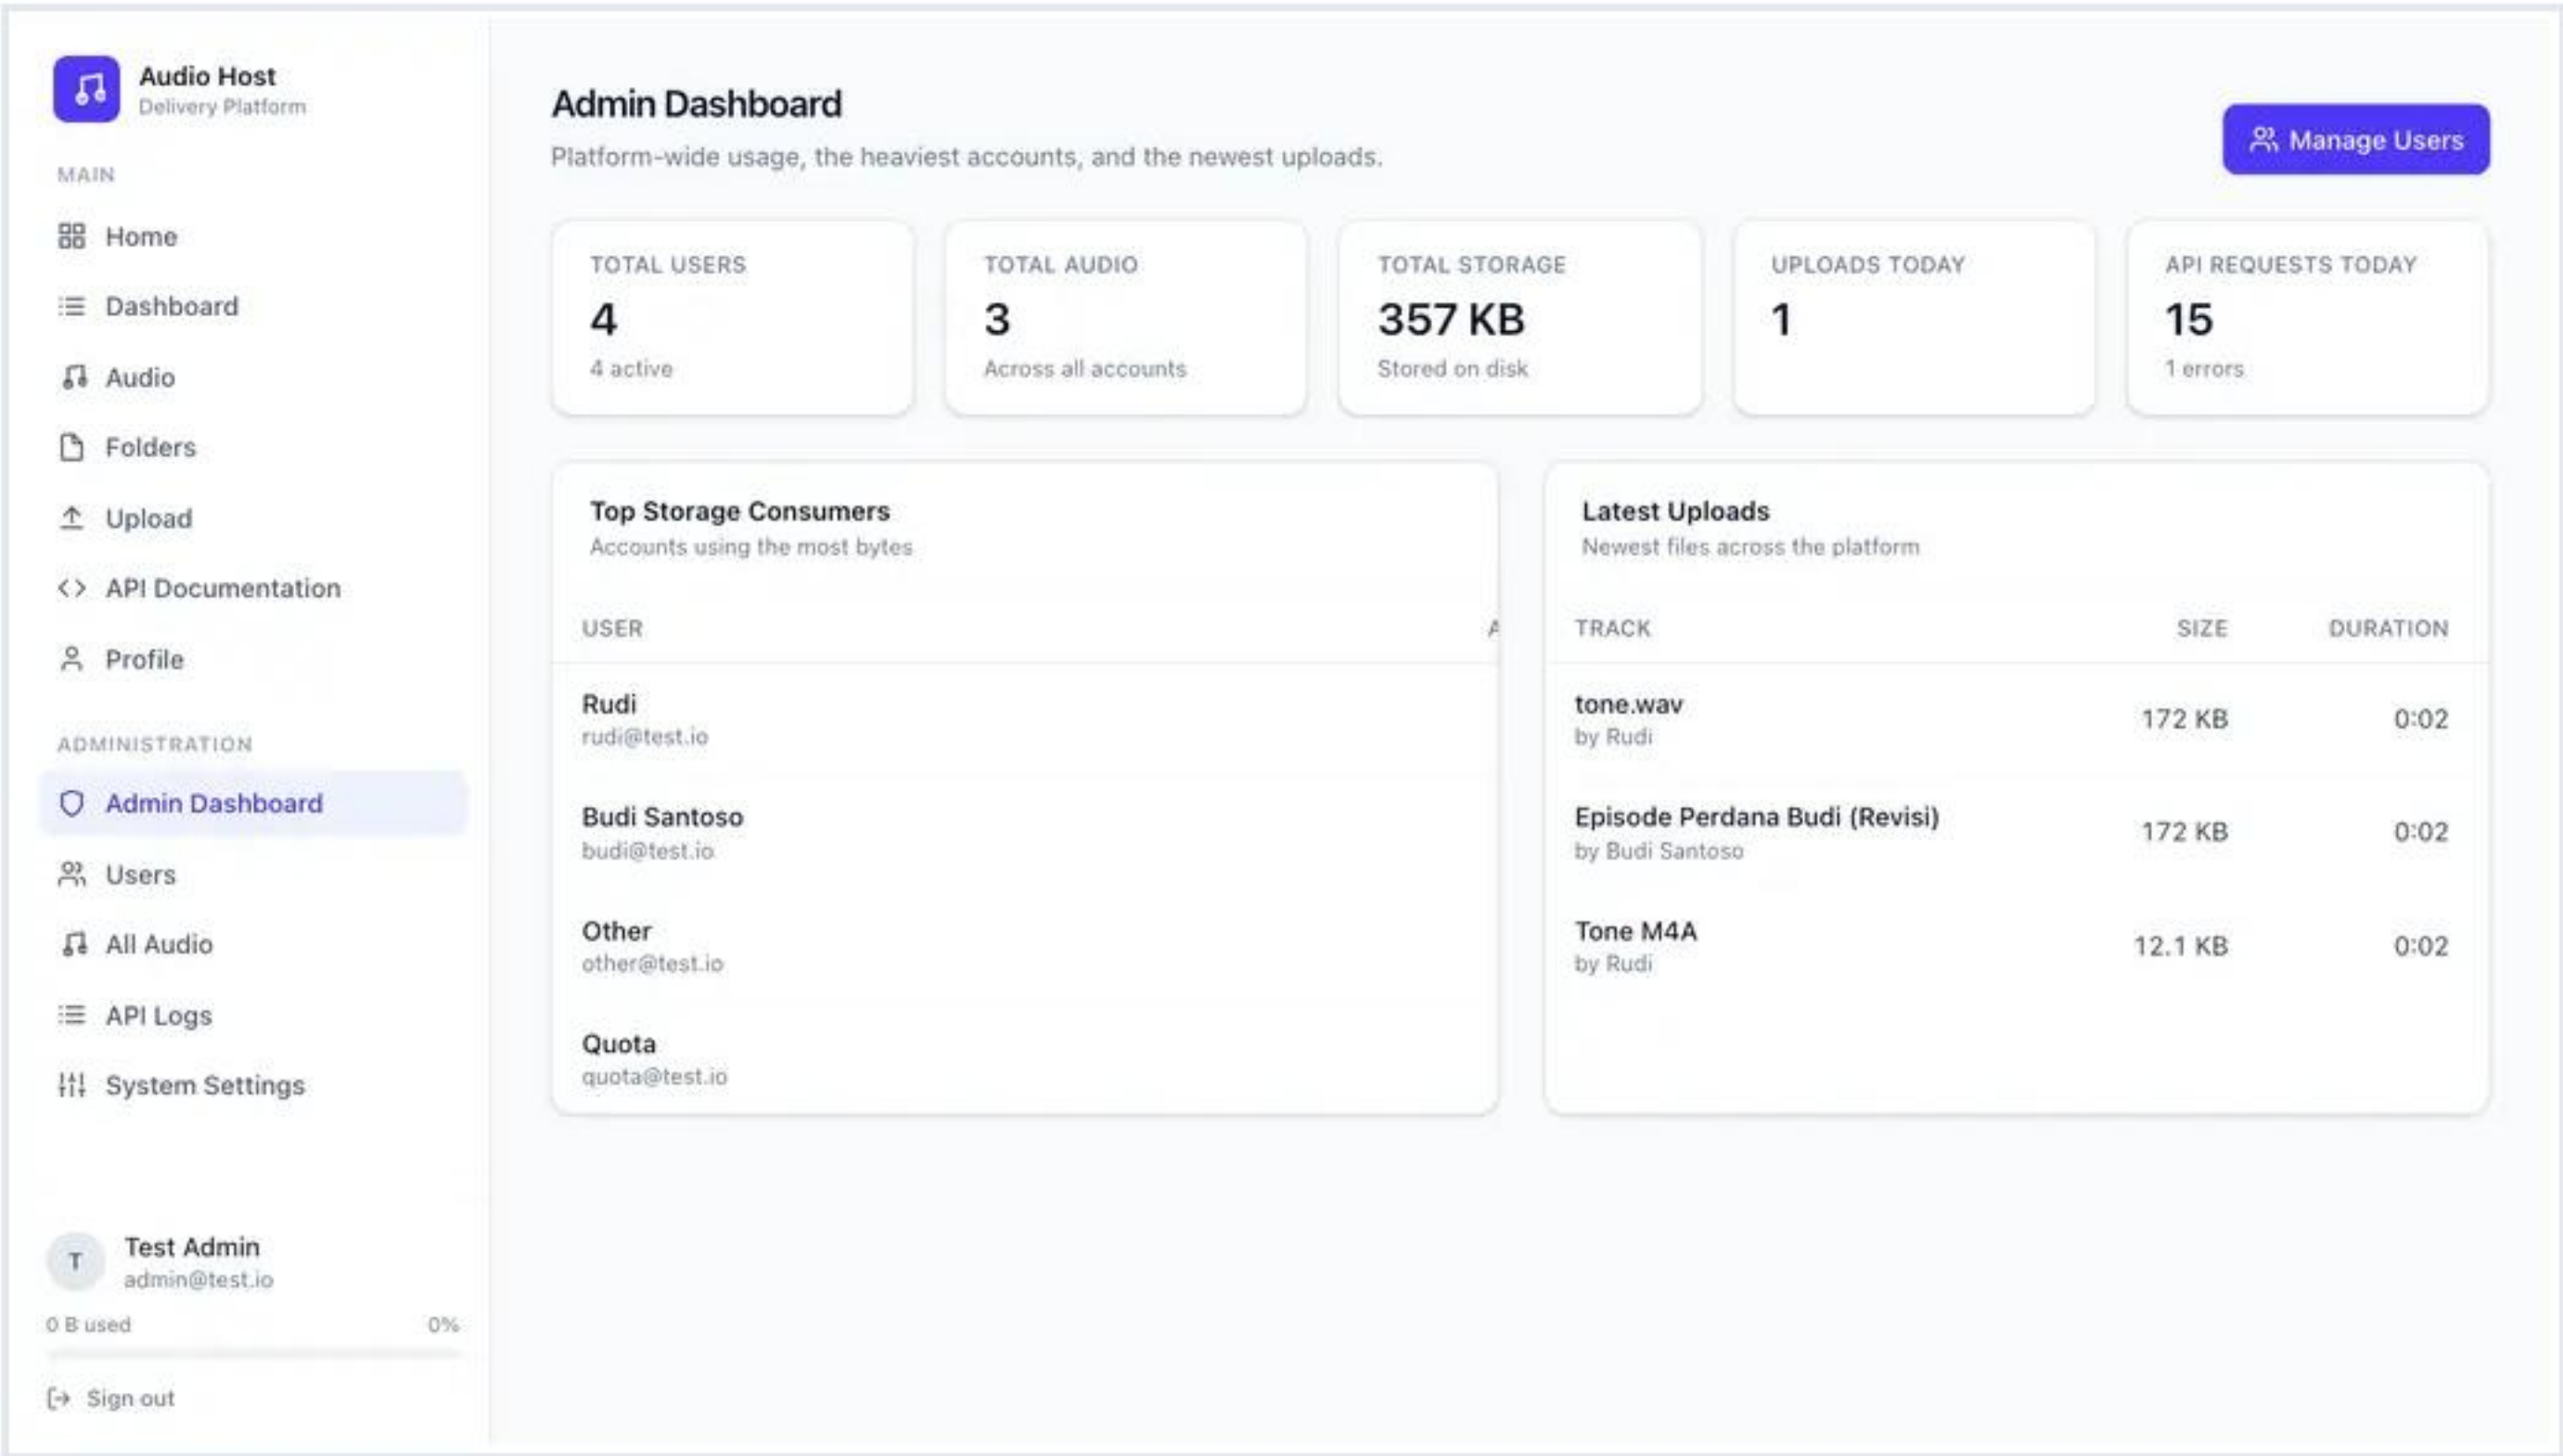

Figure 9 — Admin: Dashboard & Users

09 • ADMIN: AUDIO, LOGS & SETTINGS

All Audio covers every account with owner/format/search filters: play, copy URL/embed, download, delete.

API Logs records each /api/v1 request (user, method, path, status, response time, IP, user agent) with user/status/path/date filters.

System Settings edits API & upload rate limits, max file size, default user quota, CORS origins and APP_URL — applied instantly, no restart.
